

Get Data in Power BI Desktop

Project Summary

Working from the AdventureWorksDW2020 sample data warehouse, I connected Power BI desktop to a local SQL Server instance and imported 6 related tables and then added 2 CSV files. Then used built-in profiling tools to make sure data is on correct.

Data sources connected	Rows/ columns reviewed	Issues identified
- 1 SQL Sever database (6 tables) + 2 CSV files	- DimEmployee alone: 33 columns and 296 rows	- 2 data quality issues flagged for cleanup

Figure/ Evidence of profiling:

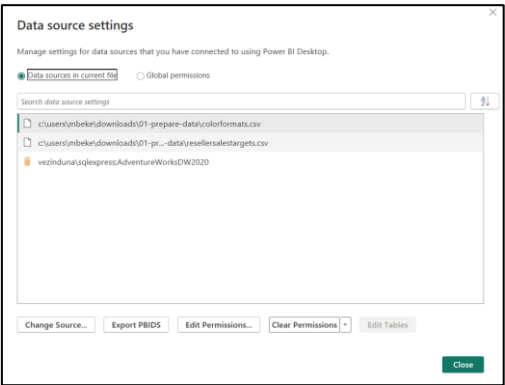

Figure 1: Data source(CSV and SQL)

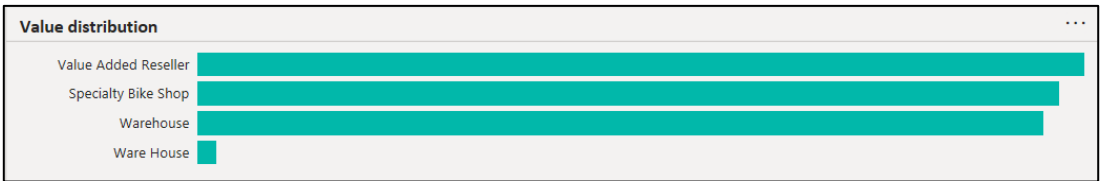

Figure 2: Data quality issue: there are two labels for warehouse (Warehouse, and the misspelled Ware House)

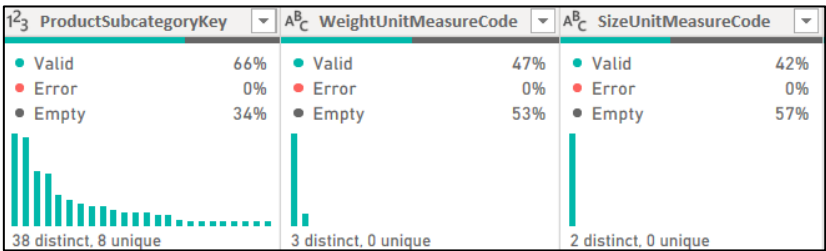

Figure 3: Null cells that will need fixing
